rationale for the

requested program revision.

03/19/2023: Social Sciences faculty voted unanimously on March 13, 2023, to place the Science,

Technology, and Society (STS) program on hiatus status. Reasons: (i) Social Sciences wish to consolidate the existing programs (including STS) into the upcoming Public Policy program. (ii)
The program currently has no student majors and historically has never had more than two

students in the major.

Narrative description of how the institution determined the need for the program. For example, describe what need this program will address and how the institution became aware of that need. If the program is replacing a current program(s), identify the current program(s) that is being replaced by the new program(s) and provide details describing the benefits of the new program(s). If the program will be offered in connection with, or in response to, an initative by a governmental entity, provide details of that initiative.

Science, Technology and Society (STS) is a social scientific and humanistic field of study in which the primary research objects are science and technology; the processes and paradigms through which science and technology evolve; and how the results relate to society, culture and politics. Research questions typical to the field include: What is the role of users in the development of new technology? How do relevant actors and audiences adopt new technologies and scientific paradigms? Can technology discriminate, and if so, how do we "govern" its consequences? How are expertise and authority established and contested? How do we balance technological progress versus technological risk?

The program was initiated by a group of faculty with decades of teaching and research experience in sociology, politics and public policy, geography, philosophy, and history related to science and technology. They perceived a growing need, as well as the considerable strengths of Illinois Tech for delivering a program that would both serve the intellectual and career aspirations of our students and attract a new cohort of social science-oriented students to Illinois Tech. At the time these discussions began, faculty and courses were already in place that could be the foundation for an undergraduate STS major. Subsequent hires in Social Sciences and Humanities have enhanced that capacity. Therefore, the program can be delivered without additional faculty resources, using mostly existing courses, without compromising on content or quality.

STS programs have existed, in various forms, in colleges and universities in the US and UK since the mid-1970s. They range from undergraduate minors, to second majors, to stand-alone majors, to master's and doctoral degree programs. Data on the actual number of undergraduate bachelor's degree programs varies considerably, depending on the source. Cal Poly Pomona identifies 35 colleges and universities in the United States with STS programs (1). Using a somewhat broader definition, the College Board lists 71. These programs are structured and delivered differently by the wide variety of small colleges, large universities, and STEM oriented institutions that offer them (2). Regardless, STS is increasingly recognized as an important platform for education, research and career development.

Nationally, the following schools offer a standalone undergraduate major in Science and Technology Studies: Cornell, Georgia Tech, Arizona State, Lehigh, Worcester Polytechnic, Brown, University of Washington-Bothell, Bard, RPI, Vassar, University of Texas-Austin, Pomona College, University of Puget Sound, University of Pennsylvania, NYU Polytechnic, North Carolina State, Stanford, New Jersey Institute of Technology, SUNY Morrisville, Harvard, Colby, Cal Poly-Pomona, and the University of California-Davis. Several more feature a major with a narrower scope, such as majors at Princeton and Worchester Polytechnic which each combine STS with policy studies; and several schools with majors focused on the history of science and technology (University of Oklahoma and Johns Hopkins), with one school (Yale) focusing jointly on the history of medicine and public health.

While this proposed program bears similarities to established standalone STS majors in other tech schools, it also leverages distinctive resources of Illinois Tech. It would be unique in Illinois, where there is currently no standalone undergraduate STS degree program. The closest local equivalent is Northwestern University's 10-course "adjunct major" or a minor with core requirements, which draws exclusively from the social sciences and humanities and lacks significant STEM requirements.

Many of the undergraduate programs are liberal arts type programs, while our program emphasizes methodology, professional training and transferable skills in a STEM-oriented undergraduate degree program. And while our program would be locally unique, it draws from best practices of prominent and well-established national examples including similar specializations. Therefore, with this program, Illinois Tech will be able to attract local students who would otherwise have to leave the area to for a comparable degree.

Table 1 summarizes and compares the requirements of established STS programs at twelve US colleges and universities of various sizes, including four technological institutes (see, STS major proposal --tables, "Table 1: Selected existing STS program").

The relevance to STEM is recognized by the National Science Foundation (NSF), which has described STS training and education as central to solutions-oriented research in sustainability, and resilience and adaptation in the face of rapid global environmental change and the introduction of innovative technologies. A workshop organized by the NSF in 2008, "Science, Technology and Sustainability: Building a Research Agenda," emphasized the critically important role STS studies will play in advancing knowledge, research and practice in sustainability. Areas of particular importance that were identified are: 1) Socio-technical

systems, including "work in the fields of STS research [focusing] on the coupled systems that link human and social values, behavior, relationships, and institutions to science and technology (p. 3)." 2) Knowledge, ideas and values, involving "inquiries into the human and social practices and arrangements and conceptual and ethical frameworks that provide foundations for particular ways of knowing and valuing aspects of society and the environment that are critical to sustainability problems and solutions (p. 3)." 3) Science, technology and governance, with a "focus on strategies and institutions for governing science and technology in society (p. 3)." And while the report focused on support for research and graduate studies, it also noted the importance of earlier training at the high school and undergraduate levels for building capacity and diversity in STS research and practice (pp. 18-19) (3).

The NSF Science, Technology and Society program (under the Division of Social and Economic Sciences) reflects the orientation of several of the undergraduate STS programs examined in establishing the need for this program.

"The Science, Technology, and Society (STS) program supports research that uses historical, philosophical, and social scientific methods to investigate the intellectual, material, and social facets of the scientific, technological, engineering and mathematical (STEM) disciplines. It encompasses a broad spectrum of STS topics including interdisciplinary studies of ethics, equity, governance, and policy issues that are closely related to STEM disciplines, including medical science (4)."

This is backed up by STS programs at other universities. For example, the Stanford University STS program webpage lists no fewer than 11 scholarly journals that are either solely devoted to STS or contain substantial STS content(5).

Therefore, it is in the interest of Illinois Tech students to learn not only how economic, cultural, political, and social forces affect scientific endeavors and technological innovation but how, in turn, science and technology shape society, cultural values, power relations, and the distribution of resources. In the degree proposed here, a suite of core major requirements exposes students to a wide range of thinking on those vital issues; then students specialize in an area from which such knowledge is derived and to which it may be applied; and their specialization is coupled with a STEM minor or equivalent STEM content to familiarize them with an applicable technical or scientific field. In that way, students will enter the workforce and/or post-baccalaureate study with the tools to analyze the social, economic and political impacts of science and technology and the skills needed to communicate and collaborate with scientists and engineers in a wide range of professional settings, including government agencies, community-based organizations, think tanks, news and media organizations, international institutions, non-governmental organizations, and innovative businesses. Students who achieve high levels of academic success in completing the STS bachelor's degree will be able to pursue graduate studies in related fields, such as business administration, law, and public policy, STS and related masters and doctoral programs.

Data from STS programs at other colleges and universities indicate that graduates—with the appropriate additional training and experience—have also gone on to careers in medicine, engineering, product development, management, media production, engineering, and entrepreneurship. Students majoring in STS will receive career advising informed by the issues that motivate them to effect change for the betterment of society through work and/or research in their chosen fields.

The range of potential career options is broad due to the inherently inter-disciplinary nature of the STS program. In addition to introducing students to a broad assessment of the bi-directional influence of science and technology on society from both contemporary and historical perspectives, an STS education emphasizes important general skills:

- · Critical thinking and analytical problem solving;
- · Quantitative, qualitative, and other research skills;
- Communication and presentation skills including writing;
- Cross cultural and cross-disciplinary understanding; and
- \bullet The ability to contribute to multicultural and multi-disciplinary teams.

Courses in the STS degree core draw from the offerings in the Social Sciences and Humanities departments and highlight existing strengths across the Lewis College of Human Sciences. Overall, the degree strikes a balance between focus and flexibility. It is built around a core that emphasizes social science research methods and theory, as well as humanistic study of science and technology. Within the major students will chose one of two areas of concentration, a specialization in Science, Technology and Environmental Policy; or Information, Communication and Society. Free electives allow students to enhance and focus their training and broaden their perspective. In addition, in order to provide a solid foundation in a scientific, technical or related field, the program requires a minimum of 15 STEM related credits beyond

Narrative description of the worker in the first form was designed to This Astrict able the wise two day, for for the Golling complete the Course of Labor Statistic designed and the style of the statistic designed and the statistic designed

This involves promoting professional development by pairing the "soft skills" of social sciences and Nuotes nities education such as understanding complex institutional environments and analysis of Set Pobly Provincial systematical systematical structures and supported by provincial systematical syste

Jubpsnákkvetvolataf.govlósáte/des/ses/sfőterrofet/Tektimolofglyybnid_6fistacitiebitál/libbenákstropekloteptlőn bast gromensátógsíjtusítébb filelds and research methods that this degree will offer. Recent studies indicatecth attentions filelds and research methods that this degree will offer. Recent studies indicatecth attentions filelds and research methods that this degree will offer. Recent studies indicatecth attentions filelds and industries and introductive filelds and industries of the filelds and industries but also contains the following caveats.

- Employers lament the lack of "soft skills" among college graduates, especially the ability to work with diverse personalities and across different functional areas.
- Internships are important since employers prefer to hire those with professional experience(4).

This substantiates observations by several scholars and practitioners that, as much or more than technical competence, future employers look for communication and problem-solving skills, and the ability to think creatively. In other words, the current emphasis is on cognitive and social rather than technical qualifications. There is wide agreement about this across industrial fields. Moreover, students are expected to enter the job market with these capabilities already developed(5).

The record of established STS undergraduate programs regarding placement of their students in jobs, professions and graduate programs reflect a wide range of opportunities. Those programs identify careers related to science, technology and society across a variety of areas, substantiated by stories of the careers of successful alumni. These include writing and research-heavy careers in science and technology; consulting on policy and management related to emerging technologies; marketing and policy analysis for tech companies and foundations; sales and communications positions at tech and energy companies; policy specialists with federal, state and local government agencies and non-profits; administrative and academic positions at colleges and universities; and entrepreneurship involving a wide range of products and services. In addition, specific professions reported by other institutions for their STS graduates who went on for advanced graduate or professional degrees include: business systems analyst, communication support, economist, editor, financial analyst, marketing research manager, medical doctor, museum curator, non-profit founder, policy advisor, policy consultant, regulatory and compliance officer, and technology analyst(6). A particularly strong area of job growth according to the U.S. Bureau of Labor Statistics is Health Care and Social Assistance, projected to add nearly 4 million jobs by 2026, or about one-third of all new jobs(7). Students with STS degrees from other institutions have also qualified for additional, post-baccalaureate training leading to employment as Biomedical Engineer; Clinical Data Manager; Information Security Analyst; Commercial and Industrial Designers; Video Game Designers; Search Marketing Strategists; Human Factors Engineers and Ergonomists; and Management Analysts(8).

It should be understood that the data provided by established STS programs at other colleges and universities is limited and mainly anecdotal. Career paths—from completion of bachelor's degree to current position—are not specified. But they may be taken as indications of the possibilities that exist for STS majors—many of which require additional training and experience—but are difficult to anticipate.

The combination of "soft skills" and technical knowledge, from the appropriate specialization (such as Science, Technology and Environmental Policy) and STEM coursework will prepare students for fields that require social scientific knowledge and the ability to understand,

analyze and communicate relevant scientific and technical information. Opportunities for an STS graduate with, for example, an Information Security minor include positions concerned with drafting or maintenance of information security policy, as well as technical writing positions in information security(9). STS degree requirements also align well with the knowledge and skills sought by several employers hiring graduates with bachelor's degrees for work related to the challenges of environmental sustainability; such as Climate Change Analyst. O*NET lists 16 skills associated with the profession. Although 79 percent of people employed in the field have a master's degree, the work emphasizes the skills and areas of knowledge that the STS major can provide, allowing graduates to either compete for entry-level positions or pursue more advanced training.

Several courses in the specialization and STS core provide direct preparation for graduates seeking such positions. These include: PS 329, Environmental Politics and Policy; PS 338, Energy Policy; SSCI 380, International Development; and PS 388, International Law and Organizations. In addition, advisors can authorize substitutions with special topics courses, such as recent offerings in Urbanized Ecosystems, Climate Change Law and Policy, and Environmental Politics and Economic Globalization. A valuable skill set will be provided by the capstone course recommended for this specialization: SSCI 408, Methods of Policy Analysis. Careers such as those described above value research skills and policy impact analysis focused on particular types of industrial, activities, patterns of human settlement, and geography. Courses that provide useful preparation include SSCI 389, Urban Policy Analysis; SSCI 225 and 325, Geographic Information Systems; or selected social science electives, such as SSCI 388, Economic Impact Analysis; and SSCI 389, Urban Planning Analysis.

It is expected that the STS undergraduate degree will also provide suitable preparation for several master's programs in existence or under development at Illinois Tech—with an eye toward creating new co-terminal degree programs—including: Master of Public Administration, Master of Law (L.L.M.), Master of Business Administration, Master of Science in Environmental Sustainability, Master of Science in Technology and Humanities, and Master of Science in Technical Communication and Information Architecture.

Finally, a number of STS-related fellowships and internship programs exist for students and graduates. One of the best-known fellowship programs in science and technology policy is run by the American Association for the Advancement of Science, including the Tisdale Fellowship in science and technology policy(10). In addition, many of the organizations listing employment opportunities consistent with STS training also offer internships (especially in the government and not-for-profit sectors).

Narrative description o 8a Signum age: https://www.onstturtione.onsg/final.depregation.dep

"[@] FirprlayIndicional difetajilsysiesehtapst/Socialvsztiassom/g/paga/siopls/fiellprojetripedetsogroes.10 percent from 2016 to 2026, faster than the average for all occupations, which will result in about 124,800 new jobs. Increasing demand for expertise in the sciences, particularly in occupations involved in biomedical research, psychology, energy management, and environmental protection, is projected to result in employment growth."

The median annual wage for life, physical, and social science occupations was \$64,510 in May 2017, which was higher than the median wage for all occupations of \$37,690(1)."

O*NET provides data for median wages with appropriate undergraduate degrees and skill sets for several of the occupational categories mentioned above. Table 2 provides a sample of those requiring skills and knowledge acquirable through the STS major, and for which a bachelor's degree is the most common "educational level required(2)." Note that some of these occupational categories require substantial on-the-job experience and/or post-baccalaureate degrees for advancement; therefore, median wages may also reflect a substantial minority of employees with qualifications beyond a bachelor's degree. (See STS proposal--tables, Table 2: Careers obtainable with STS major.)

More specifically, and perhaps a clearer indication of entry-level salaries for graduates with BS degrees, the New Jersey Institute of Technology reports an average starting salary for its class of 2016 STS majors of \$50,775(3).

Specializations and careers

Each STS major will choose a 15 credit-hour specialization within the major and either a catalog-listed STEM minor or 15 credits of appropriate STEM coursework. The option of appropriate STEM coursework can be satisfied by an appropriately structured set of 15 credits of STEM courses outside the Core Curriculum, after consultation with the STS adviser and approval by the faculty/adviser(s) in the relevant STEM fields. Students will be advised on the selection of specialization and minor—along with course selection within the major core and elective requirements—based on their career goals and interests. With the appropriate specialization, STS majors will be prepared for fields that require social scientific knowledge and the ability to understand, analyze and communicate relevant scientific and technical information.

The following sections discuss sets of careers associated with specific combinations of specializations within the STS major, required STEM content and, where appropriate, post-baccalaureate training. These are representation samples with specified career paths, based current or recent job announcements are presented for each of the proposed specializations.

i. Specialization in Science, Technology and Environmental Policy

The specialization emphasizes political dynamics and policy challenges at multiple levels of governance—local, national, regional, and global—and the societal impacts of change in such areas as technological innovation, as well as various aspects of human security, and sustainability of the natural environment. This specialization emphasizes policy analytical tools, and the curriculum is designed to provide students with repeated opportunities to conduct policy analysis.

The specialization examines the aforementioned issue-areas as connected sets of economic and social challenges with the goal of helping students understand and contribute to societal responses. With the communication and research skills gained through the STS core requirements and IIT Core Curriculum, graduates are prepared for entry level positions in a variety of government agencies, environmental NGOs, businesses and professional organizations, and prepared for post-baccalaureate studies in STS, Environmental Studies, Public Policy, and related fields.

Many of the minors relevant for students specializing in Science, Technology, and Environmental Policy will complement a student's training in policy analysis, particularly areas targeting innovation processes at local and national levels, and environmental policy as implemented by local and national governments, and international organizations. For example:

- Students minoring in Artificial Intelligence will be able to conduct analyses on policies related to surveillance, smart policing, and the Internet of Things.
- Students seeking positions related to urban sustainability and/or environmental impacts of the built environment could minor in Architecture or Construction Management.
- Students minoring in Information Security will be able to conduct analyses on cyberattacks, malware, and the international political economy of a revamped Cold War that centers on the embedding of security risks within countries' high technology exports.

· Students interested in biodiversity conservation or the effects of environmental stressors on

health and wellness may choose to minor in Biology or Food Science and Nutrition(4).

Narrative description of now the program was reviewed or approved by, of developed in conjunction with, one or more of the following: a) business advisory committees; b) program integrity boards; c) public or private oversign or regulatory agencies (not including the state licensing/authorization agency and accrediting institutes, NGOs, financial services and management consulting; this path also strengthens agency); and d) businesses that would likely employ graduates of the program. For example, describe the steps taken to develop the program, identify when and with applications for graduate study in Public Policy Analysis.

whom discussions were held, provide relevant details of any proposals or correspondence generated, and/or describe any process used to evaluate the program.

The proposal process has benefited from the advice of experts with extensive experience in STS and related fields. It was developed by a committee of social science and humanities Career opportunities exist in both the private and public sectors. A recent posting by faculty with decades of experience researching and teaching in SI-related areas of sociology, Northwestern Medical for an Innovation Analyst requires a bachelor's or master's degree and oblitical science and public loolicy, philosophy, history, and regional science. In addition, one skills in data extraction, report generation, and information visualization(5). Chicago-based member of the committee has an undergraduate degree in metallurgical engineering, another Peak 6 recently posted a call for an entry-level Information Security Specialist who can conduct has a master's degree in chemistry and molecular biology (with mimor) in mathematics and program audits and assessments, identify security threats and evaluate "vendor due diligence physics), and a third member has a bachelor's degree in computer science and a master's questionnaires." The firm also offers internships and emphasizes that this entry level position degree in urban planning. Includes a strong focus on-the-job training(6). Environmental NGOs and advocacy groups offer faculty involved at various stages of the process carefully researched programs at other entry level opportunities for interested generalists, but many require research assistants, institutions. Three members regularly participate in professional association meetings and representatives, and associates who can make substantive policy-relevant contributions to conferences that provide opportunities to network and consult with faculty from other specific campaigns, and issue areas. A recent listing for Urban Conservation, Associate in institutions with \$15 programs including the Society for Social Studies of Science (the Michigan requires a bachelor's degree in an unspecified field. a skill set consistent with a liberal i The proposal process has benefited from the advice of experts with extensive experience in

4. Several other minors would be appropriate choices but the prerequisites for required

courses may make them inaccessible for many STS majors.

Proposed Bulletin Entry able from: https://nmhc.referrals.selectminds.com/jobs/innovation-analyst-innovationfull-time-days-21674. Last accessed November 3, 2018.

Admission Requirements FINANCIA PROPERTY OF SCHEFFRE //WYWE REAL PROPERTY PROPERTY STREET SATE FOR STREET SATE OF STREE that প্রতিপদ্ধান e 2018 rsework in the Social Sciences, Humanities and selected fields in science and Te chindred for stress the sexual nature of sales and set of the second section of the section of the second section of the section of the second section of the section of the second section of the Polices on science and technology, as well as the impact of science and technology on society, R-SAPO DUTAPS HYEMY BUTTER PROPERTY SEE OF SECULAR PROPERTY SEE OF SECULAR PROPERTY Stableinte making referstorented sisting sinct apphise a este of some in three from an army service of the contract of the con Presp. 4h23m2f018 also strikes a balance between breadth and focus, including a mix of core 120 All inherief anter activitisting in the this is a course whom to be distreased by the Ortal anti-सीर्थ Ethical aspects of science and technology, medicine and health, the history and sociology of science, human interaction with technologies and technological systems, the economics of innovation, and science and technology policy. In this way, graduates with a Bachelor of Science in STS will have a unified understanding of the interdependencies among science, technology, and society.

Through providing broad training in methodological and professional skills, the STS major prepares students for both careers and graduate studies. The training includes qualitative and quantitative research methods, Geographic Information Systems, computational analysis as well as intercultural communication skills and a professional experience through academicallysupervised internship and a rigorous, research-based academic capstone focusing on policy or program evaluation and analysis.

The objectives of the STS major are to develop in its graduates:

An understanding of the multi-faceted interactions between society, science and technology;

- -- Skills needed to analyze these interactions and to formulate policy recommendations;
- -- The ability to communicate across disciplines and cultures;
- -- The knowledge and skills to compete in today's international job market.

Students pursuing a Bachelor of Science in Science, Technology and Society (STS) learn not only how economic, cultural, political, and social forces affect scientific endeavors and technological innovation but how, in turn, science and technology shape society, cultural values, power relations, and the distribution of resources. The BS in STS prepares students for careers in government agencies, community outreach, think tanks, science journalism, international institutions, and non-governmental organizations, as well as advanced research in the history of science, humanities, political economy, and sociology. Students who successfully complete the STS degree will be able to pursue graduate studies in related fields, business administration, law, and public policy. Our career advising is based on the issues that motivate students to effect change for the betterment of society.

In addition to introducing students to a broad assessment of the bi-directional influence of science and technology on society from both a contemporary and historical perspective, the STS education emphasizes important general skills:

- -- Critical thinking and analytical problem solving;
- -- Quantitative, qualitative, and other research skills;
- -- Communication and presentation skills;
- -- Cross cultural and cross-disciplinary understanding; and
- -- The ability to contribute to multicultural and multi-disciplinary teams.

Requirements will be the same as for all other BS degree programs offered by the Social Sciences Department.

SSCI 493 may be substituted with a 300+-level STS elective.

Minors will be selected in consultation with the program director/adviser based on the student's interests, goals, and academic qualifications for successfully completing the required coursework. Transfer students may be approved for a substitution of a minimum of 15 credit hours of appropriate STEM coursework above and beyond Core Curriculum requirements. Students who enter Illinois Tech as Science, Technology, and Society majors may consult with the undergraduate program director about similar substitutions as well. All such substitutions must be approved by the program director.

Program Outcomes and Assessment Process

What are the learning goals for this program?

Learning goal	Courses/student work used to assess achievement of this goal
Demonstrates understanding of major concepts and theoretical principles in the field	Selected assignment from LCHS 2XX
Demonstrates understanding of scholarly work	Selected assignment from LCHS 2XX
Students will be able to describe and explain key components of the societal and cultural impacts of institutions, practices, and developments related to science and technology	Selected assignment from LCHS 2XX
Students will demonstrate their ability to define the challenges brought about by science and technology, and determine their impact	Selected assignment from LCHS 2XX
Students will demonstrate that they can critically review theoretical explanations of societal problems and solutions	Literature review assignment from upper level course in major core
Students will demonstrate their ability to justify evidence-based assumptions or recommendations	Research-based assignment from any upper level course taken for major
Students will be able to articulate and defend arguments that are clear, logical and substantive	Written assignment from selected upper level course required for major
Students will be able to disseminate and explain research results in different formats	Final paper for PS 408 OR SSCI 486 AND presentation on SSCI 493 internship

In what semesters will the data be collected to assess this learning goal, and by whom?

STS undergrad program director will collect data at the end of each spring semester.

Provide the name of the rubric that will be used to assess the extent to which students are achieving this learning goal.

An appropriately revised version of the rubrics currently used for the Social and Economic Development Policy major will be used.

How often and by whom will the data be analyzed? What benchmarks or targets will be used to interpret your results?

Annually.

Briefly describe the used to share the results with faculty and use these to motivate program improvement.

Assessment will be done by a subcommittee of the STS Curriculum Committee plus an outside process that will be member; all will be core faculty in the department. Data and findings will be uploaded to a Google Drive folder accessible by all Social Sciences Department faculty and participating faculty from Humanities. Results and recommendations will be examined by the STS Curriculum Committee. Changes proposed on the basis of the findings will be submitted to the Social Science faculty for approval.

Undergraduate Program Requirements

Undergraduate Degree Requirements

Minimum credit hours

128

Specialization required?

Yes

Notes about specialization

Students will chose one of two 15-credit-hour specializations: Science, Technology and

Environmental Policy; or Information, Communication, and Society.

requirement

Minor required? Yes

How many credit

15

hours are required for the minor?

Details about the minor requirement A minor or the equivalent is required to provide a focused STEM component to the STS major. Minors will be selected in consultation with the program director/advisor based on the student's interests and goals and academic qualifications for successfully completing the required coursework. Typically, students will take a minor linked to their chosen specialization within the major and their career goals and intellectual interests. Students transferring into the STS major from other Illinois Tech majors or other institutions may be approved for substitution of a minimum of 15 credit hours of appropriate STEM coursework (above and

beyond Core Curriculum requirements). Students who enter Illinois Tech as STS majors may consult with the STS undergraduate program director about similar substitutions as well. All

such substitutions must be approved by the program director.

List Major Course Requirements

DISTRIBUTION OF CREDIT HOURS

Major Core (30 credits):

LCHS 2XX: Introduction to Science, Technology and Society (3 credits)

PS 332: Politics of Science and Technology (3 credits)

SOC 301: The Social Dimensions of Science

SOC 322: Sociology of Objects and Technology (3 credits)

HUM 380: History of Science OR HIST 375: History of Computing (3 credits)

PHIL 360: Ethics (3 credits)

SSCI 209: Social Science Research Methods (3 credits)

ONE additional theory course from the following (3 credits)*

SOC 302: Science and Belief OR SOC 303: Science in Society OR PHIL 351: Science and Method

TWO additional research methods courses chosen from the following (6 credits):

SSCI 225: Introduction to Geographic Information Systems (GIS)

SSCI 325: Intermediate GIS SOC 305: Social Communication COM 383: Social Networks

SSCI 385: Computational Social Science

SSCI 386: Qualitative Social Science Research Methods

SSCI 387: Fieldwork Methods SSCI 389: Urban Planning Analysis* COM 435: Intercultural Communication SSCI 480: Introduction to Survey Methodology

Specialization (15 credits) - Choose one area of specialization, and take at least 5 courses, following the requirements for your chosen specialization. Course substitutions or an alternative specialization may be taken with advisor's approval.

(i) Science, Technology, and Environmental Policy

SSCI 378: Innovation Policy

PS 306: Politics and Public Policy OR PS 313: Comparative Public Policy*

And THREE of the following:

PS 306: Politics and Public Policy OR PS 313: Comparative Public Policy*

PS 329: Environmental Politics and Policy

PS 338: Energy Policy

SSCI 204: States, Markets, and Society

SSCI 354: Urban Policy

PS 360: Global Political Economy OR PS 388: International Law and Organizations

SSCI 320: Sociology of Accidents, Disasters and Security

SSCI 318: Global Health SSCI 359: Humans, Ecology, and Environment SSCI 380: International Development (ii) Information, Communication, and Society And ONE of the following: HIST 355: Digital Labor

PHIL 370 Engineering Ethics OR PHIL 380* Ethics of Communications Technology

Options

An appropriate STEM minor or 15 credits of STEM coursework is required.

A minor or the equivalent is required to provide a focused STEM component to the STS major. Minors will be selected in consultation with the program director/advisor based on the student's interests and goals and academic qualifications for successfully completing the required coursework. Typically, students will take a minor linked to their chosen specialization within the major and their career goals and intellectual interests. Students transferring into the STS major from other Illinois Tech majors or other institutions may be approved for substitution of a minimum of 15 credit hours of appropriate STEM coursework (above and beyond Core Curriculum requirements). The required STEM content can be satisfied either by taking an existing minor, or by an appropriately structured set of 15 credits of STEM courses outside the core curriculum, after consultation with the STS adviser and approval by the adviser/faculty in the relevant STEM field(s).

Students who enter Illinois Tech as STS majors may consult with the STS undergraduate program director about similar substitutions as well. All such substitutions must be approved by the program director.
